When people seek psychological support, formulation is the theory-driven methodology used by many

practitioners to guide identification of the processes, mechanisms, and patterns of behaviour that appear to be contributing to the presenting difficulties. However, the process of formulating – or applying psychological theory to practice – can often seem unclear. In this volume, we present multiple demonstrations of formulation in action – written by applied psychologists embedded in clinical training, research, and practice. The volume covers a range of contemporary approaches to formulation and therapy that have not been considered in extant works, and includes unique sections offering critical counter-perspectives and commentaries on each approach (and its application) by authors working from alternative theoretical positions.

A History of Modern Psychology

When experience with uncontrollable events gives rise to the expectation that events in the future will also elude control, disruptions in motivation, emotion, and learning may ensue. "Learned helplessness" refers to the problems that arise in the wake of uncontrollability. First described in the 1960s among laboratory animals, learned helplessness has since been applied to a variety of human problems entailing inappropriate passivity and demoralization. While learned helplessness is best known as an explanation of depression, studies with both people and animals have mapped out the cognitive and biological aspects. The present volume, written by some of the most widely recognized leaders in the field, summarizes and integrates the theory, research, and application of learned helplessness. Each line of work is evaluated critically in terms of what is and is not known, and future directions are sketched. More generally, psychiatrists and psychologists in various specialties will be interested in the book's argument that a theory emphasizing personal control is of particular interest in the here and now, as individuality and control are such salient cultural topics.

Abnormal Psychology

Grounded in cutting-edge scientific research, this book presents innovative ways to explore and work with emotions in psychotherapy. Preeminent clinician-researcher Stefan G. Hofmann accessibly explains how emotions operate, what influences them, and how they can cause distress. He presents strategies that can significantly improve existing evidence-based treatments and promote positive affect and happiness. Clinicians are guided to help clients with any diagnosis gain emotional awareness and use emotion regulation techniques, mindfulness-based practices, and other effective strategies. "In Practice" sidebars highlight specific clinical issues and offer illustrative case vignettes.

Using cases from the authors' files or from case files of other working clinicians, CASEBOOK IN ABNORMAL PSYCHOLOGY portrays the rich and arresting nature of disorders manifested in real people. Cases illustrate every major DSM-IV category, followed by a therapy outcome section that tells the rest of the story of what happened to these clients. Using an integrative approach, the authors emphasize the multiple causes of disorders and incorporate developmental and cultural issues in each case. Complex cases are presented without a diagnosis, so students can come up with a diagnosis on their own. This Fourth Edition includes a new case on body dysmorphic disorder as well as two new cases without a diagnosis. Abnormal And Clinical Psychology: An Introductory Textbook

Psychological Criminology addresses the question: what is it about individuals and their experiences that cause them to commit crime and/or to become criminal? This book provides a comprehensive coverage of psychological theories of crime and criminality, exploring theories focusing on factors present at birth (human nature, heredity); theories that focus on factors that influence the offender over the lifespan (learning, development); and theories focusing on factors present at the crime scene. It

emphasizes the connections among the different approaches, and demonstrates how, taken together rather than as rival explanations, they provide a more complete picture of crime and criminality than each provides individually. Theories are arranged throughout the book in a temporal sequence, from distal to proximal causes of crime. The analysis spans 100,000 years, from the evolutionary roots of criminal behaviour in the ancestral environments of early humans on the African savana, to the decision to engage in a specific criminal act. Key features of the book include: a focus on theory – ‘explaining’ crime and criminality, an integrative approach, accessible to readers who do not have a background in psychology. Psychological Criminology highlights the contributions that psychological theory can make to the broader field of criminology; it will be of interest to students, academics, researchers and practitioners in both criminology and forensic psychology.
