For nearly 80 years, shaft-drive boxer twins have traditionally formed the backbone of the BMW motorcycle line-up. For many enthusiasts of the Bavarian marque the classic BMW twin was the R90S of 1973-76. Over the decades, successive generations of durable machines - including the R100S, fully-faired R100RS, four-cylinder K-series, high-performance R1100RS and an entire family of touring and sporting models ranging from 850 to 1200cc - would ensure the BMW boxer twins a place in the Haynes "Great Bikes" series. This book covers: historical context, racing, the wartime R75 and R69S; the "75" series which enabled BMW to compete with the high-performance Japanese machines; the R90S, the "76" and Superbike performance; the R100RS, the "77" and the touring R100RT; smaller twins, smaller potential; the R89G/S, including a Paris-Dakar version; rationalization of the boxer range, and the new twins that included four-valve heads and electronic engine management; and technical specifications from 1969 to 2003.

Silicon technology now allows us to build chips consisting of tens of millions of transistors. This technology not only promises new levels of system integration onto a single chip, but also presents significant challenges to the chip designer. As a result, many ASIC developers and silicon vendors are re-examining their design methodologies, searching for ways to make effective use of the huge numbers of gates now available. These designers see current design tools and methodologies as inadequate for developing million-gate ASICs from scratch. There is considerable pressure to keep design team size and design schedules constant even as design complexities grow. Tools are not providing the productivity gains required to keep pace with the increasing gate counts available from deep submicron technology. Design reuse - the use of pre-designed and pre-verified cores - is the most promising opportunity to bridge the gap between available gate-count and designer productivity. Reuse Methodology Manual for System-On-A-Chip Designs, Second Edition outlines an effective methodology for creating reusable designs for use in a System-on-a-Chip (SoC) design methodology. Silicon and tool technologies move so quickly that no single methodology can provide a permanent solution to this highly dynamic problem. Instead, this manual is an attempt to capture and incrementally improve on current best practices in the industry, and to give a coherent, integrated view of the design process. Reuse Methodology Manual for System-On-A-Chip Designs, Second Edition will be updated on a regular basis as a result of changing technology and improved insight into the problems of design reuse and its role in producing high-quality SoC designs.

In the late nineteenth and early twentieth centuries, working-class Americans had eating habits that were distinctly shaped by jobs, families, neighborhoods, and the tools, utilities, and size of their kitchens—along with their cultural heritage. *How the Other Half Ate* is a deep exploration by historian and lecturer Katherine Turner that delivers an unprecedented and thoroughly researched study of the changing food landscape in American working-class families from industrialization through the 1950s. Relevant to readers across a range of disciplines—history, economics, sociology, urban studies, women’s studies, and food studies—this work fills an important gap in historical literature by illustrating how families experienced food and cooking during the so-called age of abundance. Turner delivers an engaging portrait that shows how America’s working class, in a multitude of ways, has shaped the foods we eat today.

It is a very special honour for me to be able to present this handbook of medical oncology, which under diverse headings and origins covers such a vast spectrum of experience. I believe the reader will be struck in particular by the impressive volume of information available, especially with regard to childhood tumours, which represent, today, an immense "laboratory of hope". It is in this very field that we oncologists have been able to obtain the most consoling results in recent years. I feel sure that all those who read these chapters will find that their oncological competence is enriched and also in a certain sense that their wish to contribute to progress in cancer research and treatment has been renewed. In conclusion, my most heartfelt congratulations go to the authors for the excellent job they have done, as well as my admiration for having been able to concentrate so much precious and innovative information into so little space. Umberto Veronesi
Preface Since 1976, the VICC has been holding chemotherapy courses in all parts of the world, excluding North America and Australia. This book is the first comprehensive post-war history of one of Europe's most vibrant cities throughout an extraordinary period of social, cultural and economic change. The capital of Italy's economic miracle of the 1950s and 60s, Milan was a

magnet for immigrants, as industry, design and culture created a heady mix of wealth, innovation and conflict. By the 1980s, heavy industry had all but disappeared and the city had reinvented itself as the world capital of fashion and a dynamic post-industrial metropolis. Meanwhile, the urban landscape was darkened by the bleak estates of the peripheries and the corruption scandals that exploded in what became known as 'Tangentopoli', or Bribesville. This fascinating book traces Milan's 'biography' through its buildings, design, fashion, cinema, families, immigrants and television. The city emerges as a potent economic power-house and laboratory for change, where art and culture converge in a modern but problematic urban space. Anyone interested in Italian history, urban studies or the future of Europe's cities will find this book an essential read.
