Handbook of Pain Assessment, Third Edition

This comprehensive yet practical handbook consolidates information needed by health psychologists working alongside other healthcare professionals. It facilitates the progression of the learner from the classroom to the clinical setting by focusing on the translation of science to practice using practical examples. The Handbook is divided into four major parts. Part I highlights practical issues faced by health psychologists in a medical setting (how to motivate patients, consultation-liaison, assessment and screening, brief psychotherapies, ethical issues, etc.) Part II concentrates on treating unhealthy behaviors (alcohol and nicotine use, noncompliance, overeating/obesity, physical inactivity, stress). Part III considers behavioral aspects of medical problems (pain management, hypertension, diabetes, cancer, sexual dysfunction, HIV/AIDS, irritable bowel syndrome, insomnia). And Part IV takes up special issues relevant to practice and research in the field (minority issues, women's issues, working with geriatric populations, public health approaches to health psychology and behavioral medicine). The Handbook will prove to be an invaluable resource for those already working in the

field of health psychology as well as for those in training. .

Rothman-Simeone the Spine

"What a marvelous and amazing textbook. Drs. Marini, Glover-Graf and Millington have done a remarkable job in the design of this highly unique book, that comprehensively and very thoughtfully addresses the psychosocial aspects of the disability experience. These highly respected scholars have produced a major work that will be a central text in rehabilitation education for years to come." From the Foreword by Michael J. Leahy, Ph.D., LPC, CRC Office of Rehabilitation and Disability Studies Michigan State University "This is an excellent book, but the best parts are the stories of the disabled, which give readers insights into their

struggles and triumphs." Score: 94, 4 Stars--Doody's Medical Reviews What are the differences between individuals with disabilities who flourish as opposed to those who never really adjust after a trauma? How are those born with a disability different from individuals who acquire one later in life? This is the first textbook about the psychosocial aspects of disability to provide students and practitioners of rehabilitation counseling with vivid insight into the experience of living with a disability. It features the first-person narratives of 16 people living with a variety of disabling conditions, which are integrated with sociological and societal perspectives toward disability, and strategies for counseling persons with disabilities. Using a minority model perspective to address disability, the book focuses on historical perspectives, cultural variants regarding disability, myths and misconceptions, the attitudes of special interest and occupational groups, the psychology of disability with a focus on positive psychology, and adjustments to disability by the individual and family. A wealth of counseling guidelines and useful strategies are geared specifically to individual disabilities. Key Features: Contains narratives of people living with blindness, hearing impairments, spinal cord injuries, muscular dystrophy, polio, mental illness, and other disabilities Provides counseling guidelines and strategies specifically geared toward specific disabilities, including "dos and don'ts" Includes psychological and sociological research relating to individual disabilities Discusses ongoing treatment issues and ethical dilemmas for rehabilitation counselors Presents thought-provoking discussion questions in each chapter Authored by prominent professor and researcher who became

disabled as a young adult

The Biopsychosocial Model of Health and Disease

Pain syndromes involve a complex interaction of medical and psychological factors. In each syndrome unique physiological mechanisms are mediated by emotional states, personality traits, and environmental pressures to determine the nature and extent of pain complaints and pain-related disability. The Handbook addresses the complexities of chronic pain in three ways. Section I describes general concerns that cross-cut the different syndromes, such as the use of narcotic pain medications, the detection of deception and malingering, and the epidemiology of pain. Section II presents comprehensive reviews of a wide range of pain syndromes. Each covers basic pathophysiology, psychological factors found to influence the course of the syndrome, and syndrome-specific multidisciplinary treatment approaches. Most of the Section II chapters are coauthored by psychologists and physicians. Section III discusses pain in special populations, including the elderly and children. The Handbook is the most up-to-date, comprehensive, and integrated single-volume resource for all those professionally concerned with pain.

Chronic back and neck pain. Whiplash. Fibromyalgia. Carpal tunnel syndrome. Intractable headaches. Depression. Anxiety and posttraumatic stress. Concussion. More than ever, the term workplace disabilities is synonymous with greater clinical and case management complexity and escalating personal, social, occupational and economic cost. Complex illnesses and injuries that defy a traditional medical management model continue to baffle medical, mental health, rehabilitation, compensation, corporate, and legal professionals despite new advances in diagnosis, prevention, and rehabilitation. The Handbook of Complex Occupational Disability Claims: Early Risk Identification, Intervention and Prevention cuts through the confusion by integrating current theories and findings into a state-of-

the-art tool for critical thinking, decision making, and effective practice. A book that synthesizes so many diverse viewpoints has the potential to influence both policy and practice across disciplines and cut through politicization of these still poorly understood conditions with evidence. The Handbook is important reading for all clinicians, professionals, and members of rehabilitation and disability management teams, across healthcare, occupational and compensation settings.

Cancer Pain

This open access book is a systematic update of the philosophical and scientific foundations of the biopsychosocial model of health, disease and healthcare. First proposed by George Engel 40 years ago, the Biopsychosocial Model is much cited in healthcare settings worldwide, but has been increasingly criticised for being vague, lacking in content, and in need of reworking in the light of recent developments. The book confronts the rapid changes to psychological science, neuroscience, healthcare, and philosophy that have occurred since the model was first proposed and addresses key issues such as the model's scientific basis, clinical utility, and philosophical coherence. The authors conceptualise biology and the psychosocial as in the same ontological space, interlinked by systems of communication-based regulatory control which constitute a new kind of causation. These are distinguished from physical and chemical laws, most clearly because they can break down, thus providing the basis for difference between health and disease. This work offers an urgent update to the model's scientific and

philosophical foundations, providing a new and coherent account of causal interactions between the biological, the psychological and social.

The highly anticipated new edition of Pain: a textbook for health professionals (previous subtitle a textbook for therapists) has undergone a major rewrite in order to reflect the rapid developments in the field of pain management. It highlights an effective and evidence-based method, providing the theoretical basis to help with the assessment and management of persistent pain, while also discussing in depth a range of specific approaches. Pain: a textbook for health professionals is written emphatically from a biopsychosocial perspective. In order to set the scene, the introductory section includes chapters on the patient's voice and social

determinants of pain. This ensures that the deeply personal and social aspects of pain are not lost among the more technical and biological commentary. These aspects provide an overall context, and are revisited in chapters on participation of life roles, work rehabilitation and psychology. The basic science section includes key chapters on the psychology, neuroanatomy and neurophysiology of pain. This provides a basis for subsequent chapters on specific approaches such as pharmacology, physical therapy and complementary medicine. Pain in specific patient groups, including children, the elderly and those with cancer, are dealt with in separate chapters, as are pain problems such as complex regional pain syndrome and chronic spinal pain. Although the emphasis of the book is on long term pain, acute pain is discussed as a possible precursor and determinant of chronicity.
