In today's world of scarce resources, determining the optimal allocation of funds to preventive health care interventions (PHIs) is a challenge. The upfront investments needed must be viewed as long term projects, the benefits of which we will experience in the future. The long term positive change to PHIs from economic investment can be seen across multiple sectors such as health care, education, employment and beyond. Applied Health Economics for Public Health Practice and Research is the fifth in the series of Handbooks in Health Economic Evaluation. It presents new research on health economics methodology and application to the evaluation of public health interventions. Looking at traditional as well as novel methods of economic evaluation, the book covers the history of economics of public health and the economic rationale for government investment in prevention. In addition, it looks at principles of health economics, evidence synthesis, key methods of economic evaluation with accompanying case studies, and much more. Looking to the future, Applied Health Economics for Public Health Practice and Research presents priorities for research in the field of public health economics. It acknowledges the role played by natural environment in promoting better health, and the place of genetics, environment and socioeconomic status in determining population health. Ideal for health economists, public health researchers, local government workers, health care professionals, and those responsible for health policy development. Applied Health Economics for Public Health Practice and Research is an important contribution to the

economic discussion of public health and resource allocation.

For occupational therapists who want to incorporate health promotion or prevention into their practices, here is a thought-provoking new volume. Health Promotion and Preventive Programs highlights existing models of occupational therapy practice, targeting populations ranging from infants to the elderly, that incorporate principles of prevention and health promotion into traditional health care practice arenas. This important new book describes a variety of occupational therapy services, each of which uses principles of primary, secondary, or tertiary prevention principles, including a health education program for parents of well babies and toddlers, a community outreach program for preschool children who are at risk for emotional problems, a community support group formed by adults who have been hospitalized for psychiatric illnesses, a

program designed to prevent industrial accidents through on-the-job training, and a home safety program for the elderly. The effective case study approach will allow occupational therapists to learn about and compare various models of practice, and includes elements necessary for development, organization, and design of health promotion and disease prevention programs. Together the chapters provide theoretical concepts of health promotion and injury prevention and offer a framework by which professionals can analyze material, determine whether or not programs can be appropriately replicated, or design new and original occupational therapy programs having a focus on health promotion and/or disease prevention.

Issues in Economics is structured around major policy issues and is divided into three parts: "Introduction to Issues in Economics," "Microeconomic Issues," and "Macroeconomic Issues." The first three chapters are basic introductions to the subject matter of economics with emphasis on theory, institutions, and policy. In "Macroeconomic Issues," the first chapter's focus is "Measuring Economic Activity." This chapter develops the accounting framework on which macroeconomic theory is based. Technological change in healthcare has led to huge improvements in health services and the health status of populations. It is also pinpointed as the main driver of healthcare expenditure. Although offering remarkable benefits, changes in technology are not free and often entail significant financial, as well as physical or social risks. These need to be balanced out in the setting of government regulations, insurance contracts, and individuals' decisions to use and consume certain technologies. With this in mind, this book addresses the following important objectives: to provide a detailed analysis of what technological change is; to identify drivers of innovation in several healthcare areas; to present existing mechanisms and processes for ensuring and valuing efficiency and development in the use of medical technologies; and to analyse the impact of advances in medical technology on health, healthcare expenditure, and health insurance. Each of the seventeen chapters summarizes an important issue concerning the innovation debate and contributes to a better understanding of the role innovation has both at the macro level and at the delivery (meso) and micro level in the healthcare sector. The effectiveness of innovation in improving people's welfare depends on its diffusion and inception by the relevant agents in the health production process, and this book recognizes the multi-faceted contribution of policy makers, regulators, managers, technicians, consumers and patients to this technology change. This book offers the first truly global economic analysis of healthcare technologies, taking the subject beyond simply economic evaluation, and exploring the behavioural aspects, organization and incentives for new technology developments, and the adoption and diffusion of these technologies.
