## Managing Information & Systems

THE REALITY BEHIND SYSTEM SUCCESS Steven Alter's "Information Systems: Foundation of E-Business, fourth edition," emphasizes the essential role information systems play in today's successful businesses. Viewing information systems from a business perspective, is essential for understanding how e-commerce and e-business really work and for appreciating why technology is not a magic bullet that solves all problems. Most current business practices rely on IT, but successful application of any technology involves much more than the technology itself. Today's managers need a way to understand and evaluate the impact and use of technology in their businesses. "This book is an indispensable tool for business and IT students because it: " provides a rigorous, yet non-technical approach, that any manager, executive, or business professional can use

to visualize and analyze system-related opportunities and problems that confront almost every company in today's economy. presents a practical, straightforward approach for attaining business results, recognizing possibilities, and avoiding the wasted time and effort consumed by technology initiatives that never achieve their goals. combines the vocabulary of today's technologies with problem solving tools and methods that business and IT students can continue to use in the future. This text's updated coverage of the work system framework and principles, e-business and e-commerce, value and supply chains, ERP systems, networks, and system security, help explain how technology applications make a difference. Its companion web site ([www.prenhall.com/alter](http://www.prenhall.com/alter)) extends the book's coverage. The balance of theory and practice in this text makes "Information Systems: Foundation of E-Business, fourth edition," a resource that business and IT students can use even after new generations of technology have replaced those of today.

Managing information technology (IT) on a global scale presents a number of opportunities and challenges. IT can drive the change in global business strategies and improve international coordination. At the same time, IT can be an impediment to achieving globalization. IT as an enabler of and inhibitor to globalization raises interesting questions. *Global Perspective of Information Technology Management* provides a collection of research works that address relevant IT management issues from a global perspective. As the world economy becomes more interdependent and competition for business continues to be more globally oriented, it has, likewise, become necessary to address the issues of

the world, yet its health outcomes as measure by longevity are in the bottom half among developed countries, and its health-related quality of life has remained constant or declined since 1998. In addition to high costs and lower than expected outcomes, the healthcare delivery system is plagued by treatment delays as it can take weeks to see a specialist, and many people have limited or no access to care. Part of the challenge is that the healthcare delivery system is a large, complex, and sophisticated value creation chain. Successfully changing this highly interconnected system is difficult and time consuming because the underlying problems are hard to comprehend, the root causes are many, the solution is unclear, and the relationships among problems, causes, and solution are multifaceted. To address these issues, the book carefully explains the underlying problems, examines their root causes using information, data, and logic, and presents a comprehensive and integrated solution that addresses these causes. These three steps are the methodological backbone of this book. A solution depends on understanding and applying the principles of patient-centered care (PCC) and resource management. PCC puts patients, supported by their primary care physicians, back in the role as decision makers and depends on patients being responsible for their health including making good life-style choices. After all, the best way to reduce healthcare costs and increase quality of life is to improve our health and wellness and as a result need less care. In addition, health insurance must be rethought and redesigned so it is less likely to lead to overuse. For many people with health insurance, the out-of-pocket cost of

healthcare are small, so healthcare decision making is often biased toward consumption. Effective resource management means that healthcare providers must do a better job of acquiring and using resources in order to provide care quickly, productively, and correctly. This means improving healthcare strategy and management, accelerating the use of information technology, making drug costs affordable and fair, reducing the incidence of malpractice, and rebuilding the provider network. In addition, implementation is difficult because there are many participants in the healthcare delivery value chain, such as physicians, nurses, and medical technicians, as well as many provider organizations, such as hospitals, clinics, physician offices, and labs. Further up the value chain there are pharmaceutical companies, equipment providers, and other suppliers. These participants have diverse and sometimes conflicting goals, but each must be willing to accept change and work in a coordinated manner to improve healthcare. To overcome these problems, strong national leadership is needed to get the attention and support from the people and organizations involved in healthcare and to make the comprehensive changes that will lower healthcare costs, improve healthcare quality, eliminate delays, increase access, and enhance patient satisfaction.

It is tempting to think that, in the year 2001, our technology is very sophisticated and accordingly, it is very tempting to believe that present-day computer technology is "very advanced" (begging the question of to what?). The fact is that we have only just begun to develop computer technology, and the recent implementation of the Internet brings us to a special threshold in that development. Development stages require very careful and thoughtful management. What we do now in this present development stage will be profoundly important for future generations. The management of the foundation for the 'evolution' of computer technology is a very special case because it will also become intimately connected with the management of mankind itself, not only in groups or collectively but also, eventually, as a species.

### **Rethinking Management Information Systems**

Management functions were developed first as a systematic step to carry out management activities, while implementation of the information components followed as part of management elements. The authors point out that the use of the possibilities and advantages of quantitatively supported managerial decisions gives managers the ability to quantify the impacts of both technical (hard) and subjective (soft) constraints and improve managerial decision-making processes that would otherwise be based mostly on personal intuition and experience. To achieve the goals and benefits of excellent performance, it is necessary to design and develop integrated models that would coordinate management functions and information system components as an integrated process. These facts are presented in various case studies.

Computer systems play an important role in our society. Software drives those systems. Massive investments of time and resources are made in developing and implementing these systems. Maintenance is inevitable. It is hard and costly.

## Read Free Information Systems A Management Perspective 3rd Edition

Considerable resources are required to keep the systems active and dependable. We cannot maintain software unless maintainability characters are built into the products and processes. There is an urgent need to reinforce software development practices based on quality and reliability principles. Though maintenance is a mini development lifecycle, it has its own problems. Maintenance issues need corresponding tools and techniques to address them. Software professionals are key players in maintenance. While development is an art and science, maintenance is a craft. We need to develop maintenance personnel to master this craft. Technology impact is very high in systems world today. We can no longer conduct business in the way we did before. That calls for reengineering systems and software. Even reengineered software needs maintenance, soon after its implementation. We have to take business knowledge, procedures, and data into the newly reengineered world. Software maintenance people can play an important role in this migration process. Software technology is moving into global and distributed networking environments. Client/server systems and object-orientation are on their way. Massively parallel processing systems and networking resources are changing database services into corporate data warehouses. Software engineering environments, rapid application development tools are changing the way we used to develop and maintain software. Software maintenance is moving from code maintenance to design maintenance, even onto specification maintenance. Modifications today are made at specification level, regenerating the software components, testing and integrating them

with the system. Eventually software maintenance has to manage the evolution and evolutionary characteristics of software systems. Software professionals have to maintain not only the software, but the momentum of change in systems and software. In this study, we observe various issues, tools and techniques, and the emerging trends in software technology with particular reference to maintenance. We are not searching for specific solutions. We are identifying issues and finding ways to manage them, live with them, and control their negative impact.
