This edited book examines European external interventions in human security, in order to illustrate the evolution and nature of the European Union as a global political actor. In 2003, the EU deployed its first external mission under the European Security and Defence Policy (ESDP) with a military force to the former Yugoslav Republic of Macedonia. Since then it has instigated over 18 civilian and military missions to deal with humanitarian crises all over the world. This book presents a series of eight case studies of external interventions by the EU covering the Balkans, Africa, the Middle East, Afghanistan and Indonesia, to illustrate the nature of the EU as a global actor. Using the concept of human security to assess the effectiveness of these missions in meeting the EU's aim of being a 'force for good in the world', this study addresses two key issues: the need for an empirical assessment of EU foreign and security policies based on EU intervention in conflict and post-conflict situations and the idea of 'human security' and how this is applied in European foreign policy. This book will be of great interest to students of European Security, EU politics, human security, post-conflict reconstruction, and IR in general. Mary Kaldor is Co-Director of the Centre for the Study of Global Governance, London School of Economics and Political Science (LSE). Prior to this she worked at Sussex University as Jean Monnet Reader in Contemporary European Studies. Mary Martin is a Research Fellow at the Centre for the Study of Global Governance, the London School of Economics. From 2006-2009 she was co-ordinator of the Human Security Study Group. She was formerly a foreign correspondent and European editor for The Daily Telegraph and Guardian newspapers.

As the world moves toward renewable energy sources to combat environmental and power distribution issues, there has been a resurgence of interest in induction generators, particularly in their use in wind and hydropower generation systems. Induction machines operating as generators are rugged and cost effective, and with recent advances in control and optimization, the control design aspects are now moving from the laboratory to the desks of practicing engineers. Renewable

Energy Systems: Design and Analysis with Induction Generators presents the first comprehensive exposition of induction machines used for power generation. Focusing on renewable energy applications, the authors address virtually all aspects of the design, operation, and analysis of these systems, from the very basics to the latest technologies, including: New methods of characteristics testing, aimed at reduced test time, precision, and automation Reactive compensation techniques Control, including scalar control, vector control, and optimization techniques for peak power tracking control Interconnecting induction generators to the main grid Behavior in the presence of switched and controlled electronic converters Using PSPICE, MATLAB, PSIM, C, Pascal and Excel for modeling and simulation Robust, economical, and low maintenance, induction generators hold outstanding potential for helping to fulfill the world's energy needs. This book provides the background and the tools you need to begin developing power plants and become expert in the applications and deployment of induction generator systems.

Greater use of information and communications technologies (ICTs) marks a U.S. transition toward a "digital society" that may profoundly affect electricity supply, demand, and delivery. RAND developed four 2001-2021 scenarios of ICT evolution and assessed their implications for U.S. electricity requirements. Even large deployment of ICTs will only modestly increase U.S. electricity use over the next two decades. The more pressing concern will be how to meet the increased need for higher-quality and more-reliable power that accompanies ICT use.

Electricity Requirements for a Digital Society

This book and its accompanying CD-ROM offer a complete treatment from

background theory and models to implementation and verification techniques for simulations and linear analysis of frequently studied machine systems. Every chapter of Dynamic Simulation of Electric Machinery includes exercises and projects that can be explored using the accompanying software. A full chapter is devoted to the use of MATLAB and SIMULINK, and an appendix provides a convenient overview of key numerical methods used. Dynamic Simulation of Electric Machinery provides professional engineers and students with a complete toolkit for modeling and analyzing power systems on their desktop computers.

Here are 35 brilliant projects that will help you learn how to sew. If you've never used a needle and thread before, don't worry"start with the "Sewing Techniques" section, which simply explains how to do every stitch. Then pick something to make from one of the four chapters. In the "Toys" chapter, you'll find juggling animals, sock monsters and rag dolls, while in "Fashion Fun", there are gorgeous bags, hair accessories and more. Next, discover some brilliant "Decorations" from hanging felt stars to pretty lavender bags. Finally, "Great Gifts" is packed with ideas, such as the finger puppet cards, felt egg cosies or the sausage dog draft excluder. All the instructions and cute step-by-step artworks are easy to follow; plus, each project has a grade so that you can start with easy sewing and move onto using more advanced stitches as you get better at it.

Power System Stability and Control contains the hands-on information you need to understand, model, analyze, and solve problems using the latest technical tools. You'll learn about the structure of modern power systems, the different levels of control, and the nature of stability problems you face in your day-to-day work.
