Isaac Asimov's death on April 6, 1992, was a great loss to the world of literary science and freethought. The prolific author's vision is unmatched today, and his pointed honesty shines through in *The Roving Mind*, now reissued in this special tribute edition. This collection of essays is wide-ranging, reflecting Asimov's extraordinary skill in disseminating knowledge from across the spectrum of human thought. Some of the areas explored in this volume of 62 essays include creationism, pseudoscience, censorship, population, philosophy of science, transportation, computers and corporations of the future, and astronomy. His predictions about cloning which has only recently become the topic of public debate the theory of technophobia, and other scientific developments are astounding. In a lighter tone, Asimov includes several personal stories from his life including thoughts on his style of writing and memories of family in younger days. With tributes by Arthur C. Clarke, L. Sprague de Camp, Harlan Ellison, Kendrick Frazier, Martin Gardner, Donald Goldsmith, Stephen Jay Gould, E. C. Krupp, Frederik Pohl, and Carl Sagan. The collection is very readable and thus is accessible to a wide audience of nonscientists as well as scientists. Both adults and young people should find it interesting. -*The Physics Teacher*. . . Asimov's best include pieces detailing the present mysteries of solar astronomy, removing the mythology of cloning (backyard gardeners do it all the time), and pointing out deficiencies in the supposed chemistry expertise of Sherlock Holmes. -*Nature*

Chang and Miles (biology, Chinese U. of Hong Kong and SUNY Buffalo) review our current knowledge in two parts: part one, Mushroom science, deals mainly with the biological nature of fungi which are relevant to the development of mushroom science and the industry; part two treats mushroom technology with emphasis on *Lentinus* (shiitake). It is concerned with the principles and techniques of mushroom cultivation. Emphasis has been placed upon direct and simple methodologies that can be useful in developing countries, rather than on extensively mechanized cultivation procedures. Topics include: basic science; history and current production; nutritional and therapeutic value; physiology and genetics; preservation of cultures; *Agaricus* and *Lentinus*, and several less common cultivated mushrooms. Chang and Miles propose mushroom cultivation as a desirable use of waste material and a good source of protein in developing countries; but the price of this solid survey, will deter the impecunious. With their large brains, elaborate sense organs and complex behaviour, cephalopods are among the world's most highly

evolved invertebrates. This second edition summarises the wealth of exciting new research data stemming from over five hundred papers published since the first volume appeared. It adopts a comparative approach to causation, function, development and evolution as it explores cephalopod behaviour in natural habitats and the laboratory. Extensive colour and black-and-white photography illustrates various aspects of cephalopod behaviour to complement the scientific analysis. Covering the major octopus, squid and cuttlefish species, as well as the shelled Nautilus, this is an essential resource for undergraduate and advanced students of animal behaviour, as well as researchers new to cephalopods, in fields such as neuroscience and conservation biology. By highlighting the gaps in current knowledge, the text looks to inform and to stimulate further study of these enigmatic and beautiful animals.

Communication Research: Asking Questions, Finding Answers covers basic research issues and processes, both quantitative and qualitative, appropriate for communication students with little or no previous research methods experience. The text's guiding principle is that methodological choices are made from one's research questions or hypotheses. This avoids the pitfall in which students learn one methodology or one methodological skill and then force that method to answer all types of questions. Instead of working with one methodology to answer all types of questions, students come away understanding a variety of methods and how to apply them appropriately.

The aim of this series is to inform both professional philosophers and a larger readership (of social and natural scientists, methodologists, mathematicians, students, teachers, publishers, etc.) about what is going on, who's who, and who does what in contemporary philosophy and logic. PROFILES is designed to present the research activity and the results of already outstanding personalities and schools and of newly emerging ones in the various fields of philosophy and logic. There are many Festschrift volumes dedicated to various philosophers. There is the celebrated Library of Living Philosophers edited by P. A. Schilpp whose format influenced the present enterprise. Still they can only cover very little of the contemporary philosophical scene. Faced with a tremendous expansion of philosophical information and with an almost frightening division of labor and increasing specialization we need systematic and regular ways of keeping track of what happens in the profession. PROFILES is intended to perform such a function. Each volume is devoted to one or several philosophers whose views and results are presented and discussed. The profiled philosopher(s) will summarize and review his (their) own work in the main fields of significant contribution. This work will be discussed and evaluated by invited contributors. Relevant historical and/or biographical data, an up-to date bibliography with short abstracts of the most important works and, whenever possible, references to significant reviews and discussions will also be included.

King, The Science of Psychology (NASTA Reinforced High School Binding)

Although evolutionary developmental biology is a new field, its origins lie in the last century; the search for connections between embryonic development (ontogeny) and evolutionary change (phylogeny) has been a long one. Evolutionary developmental biology is however more than just a fusion of the fields of developmental and evolutionary biology. It forges a unification of genomic, developmental, organismal, population and natural selection approaches to evolutionary change. It is concerned with how developmental processes evolve; how evolution produces novel structures, functions and behaviours; and how development, evolution and ecology are integrated to bring about and stabilize evolutionary change. The previous edition of this title, published in 1992, defined the terms and laid out the field for evolutionary developmental biology. This field is now one of the most active and fast growing within biology and this is reflected in this second edition, which is more than twice the length of the original and brought completely up to date. There are new chapters on major transitions in animal evolution, expanded coverage of comparative embryonic development and the inclusion of recent advances in genetics and molecular biology. The book is divided into eight parts which: place evolutionary developmental biology in the historical context of the search for relationships between development and evolution; detail the historical background leading to evolutionary embryology; explore embryos in development and embryos in evolution; discuss the relationship between embryos, evolution, environment and ecology; discuss the dilemma for homology of the fact that development evolves; deal with the importance of understanding how embryos measure time and place both through development and evolutionarily through heterochrony and heterotrophy; and set out the principles and processes that underlie evolutionary developmental biology. With over one hundred illustrations and photographs, extensive cross-referencing between chapters and boxes for ancillary material, this latest edition will be of immense interest to graduate

and advanced undergraduate students in cell, developmental and molecular biology, and in zoology, evolution, ecology and entomology; in fact anyone with an interest in this new and increasingly important and interdisciplinary field which unifies biology.
