Melatonin

Everything you need to know about the sleep-regulating hormone melatonin! We've always been told maintaining a healthy sleep cycle is of utmost importance to your day-to-day health. But have we ever been told why? Anyone familiar with chronobiology (the science of natural physiological rhythms) knows that the hormone melatonin is the foundation hormone for the circadian rhythm research. In fact, melatonin and sleep research is one of the most fundamental and best-known rhythms in the human body. Disturbance of the melatonin cycle due to any reason interferes with the sleep/wake cycle, which ultimately leads to a number of other neurobehavioral and psychological problems. Due to the widespread misuse of light at night, modern societies no longer hold a clear distinction between day and night. This increase in light pollution at night interferes with the ability of the pineal gland to produce and disperse melatonin properly. As a result, either no or a severely dampened melatonin rhythm exists in individuals exposed to artificial light during the normal dark hours, which includes most people living in cities and

in all individuals who work at night. This suppression of a distinct melatonin rhythm and all other biological cycles represents a serious perturbation of the biological clock of many organs, contributing to pathophysiology. Dr. Fauteck also addresses the impact of proper supplemental melatonin and various studies and research done on the topic. Melatonin has been widely used to correct problems of sleep disorders, and while this book looks into that research further and breaks down the impact of melatonin and sleep, it also addresses research that addresses melatonin use for its ability to regulate the circadian clock in general and impact other areas of health such oxidative stress, neuropsychiatric disorders, headaches, chronic pain, digestion, diabetes, fertility, pregnancy, cancer, and many age-related diseases. In this book, Dr. Fauteck summarizes critical information related to the necessity of maintaining regular biological rhythms and describes the pathological consequences of circadian rhythm disturbances. He provides a clear description of how melatonin is produced and secreted, how the prevailing artificially imposed light/dark cycle can disturb its rhythm, and how this translates into other potential pathologies.

Melatonin

Melatonin is a neurohormone produced in the brain by the pineal gland, from the amino acid tryptophan. The synthesis and release of melatonin are stimulated by darkness and suppressed by light, suggesting the involvement of melatonin in

circadian rhythm and regulation of diverse body functions. Levels of melatonin start to increase prior to bedtime. Synthetic melatonin supplements have been used for a variety of medical conditions, most notably for disorders related to sleep. Melatonin possesses antioxidant activity, and many of its proposed therapeutic or preventive uses are based on this property. This important book presents a full spectrum of research on melatonin and is destined to become an essential reference for anyone interested in melatonin.

Melatonin in the Promotion of Health

The book aims to cover basic physiologic functions of melatonin, and its therapeutic applications in humans for a variety of clinically relevant disorders. This book contains chapters on the recent aspects of melatonin physiology, its receptors and their role in mitochondrial function, its immunomodulatory role and importance in seasonal dependent diseases, role in human reproduction, role in sleep, circadian rhythm and sleep disorders, role in neurologic disorders such as Parkinson's disease, Alzheimer's disease. Additionally, melatonin's therapeutic use in neurobehavioral disorders in children, migraine and tension headache is also covered in this book. Melatonin's antioxidant role in Duchenne's muscular dystrophy and in glaucoma have also been discussed in short chapters. Two major melatonin agonists, ramelteon and agomelatine are discussed extensively on their current clinical application and ongoing research. Two chapters on agomelatonin

and its role in mood disorders, particularly depressive disorders, are an important feature of this book. The chapters are written by experts from the global academia recognized for their original research and published work in the field of melatonin science.

Role of Melatonin and Pineal Peptides in Neuroimmunomodulation

Impact of light on animal behavior has been known for a long time-from 1925, Rowan [30] showed that lighting conditions influence gonad activity in birds and the related processes are controlled not only by means of intraorganic signals. Studies carried out in subsequent years have established that, also in mammals, the gland reacting to changes in light conditions is the pineal gland, producing a substance called melatonin. Biosynthesis of melatonin in most animals studied to date occurs at a rhythm dependent on the photocycle. The highest concentrations of this hormone-often called "the hormone of darkness"-are recorded at night. Seasonal changes in melatonin secretion conditioned by activity of the biological clock, known also as "biochemical calendar", are the key signals in the annual reproductive cycles of animals exhibiting seasonality of reproduction. Seasonality in sheep refers not only to the reproduction itself but also to lactation. One of the main hormones conditioning initiation and maintenance of lactation, synthesis of milk proteins, fat and immunoglobulins is prolactin (PRL), secreted primarily by

lactotrophic cells in the adenohypophysis. Prolactin is also produced locally by the mammary gland-the hormone of this origin is identical to prolactin secreted by the pituitary gland. Until now, it was considered that the level of milk production in mammals is determined by both genetic and environmental factors. However, in recent years, many studies focused on the role of light as a modulator of prolactin levels. In livestock, changes in light-period length play a very important role as this determines their productivity and milk yield. Photoperiod is particularly important in short-day breeder animals (sheep), for which the length of light period is associated with changes in melatonin level. The modulating effect of melatonin on secretion of prolactin may take place via two different mechanisms. One is associated with the circadian rhythm, wherein-directly or through the medium of a factor popularly termed "tuberalin"-melatonin stimulates the release of prolactin. However, this effect is short-lived and is most likely applicable only to prolactin stored in lactotrophic cells of the pituitary. The second mechanism regulating the secretion of melatonin and prolactin is associated with the annual rhythms of secretion-melatonin, due to its lipophilic characteristics, has a direct effect on the secretion of prolactin. Under natural conditions, the maximum concentration of prolactin in the blood of sheep is observed over the long-day period, during which the melatonin level decreases. The lowest prolactin concentration is observed over the short-day period, where melatonin levels are at their highest. Changes in secretion of prolactin during lactation in sheep undoubtedly affect the amount of milk produced.

One of Healthy People's 2020 goal is to increase public knowledge regarding adequate sleep and treatment of sleep disorders to improve the health and wellness of every individual. Although there is research indicating that shift work affects quality of sleep, there is a lack of research in exploring a solution to this problem. The purpose of this grant proposal is to study the effect of melatonin use on improving the quality of sleep for shift workers. The dependent variables being examined in this study include quality of sleep and the total hours of sleep. Quality

of sleep will be measured by the Pittsburgh Quality Sleep Index (PQSI). Participants will be asked to participate in a 1- month quasi experimental study with a pre-test/post-test design. They will be given either a placebo pill or melatonin for 1-month to determine if melatonin use is statistically significant in improving the quality of sleep in shift workers. This study is significant to advanced practice nursing because over 15 million Americans work either evening shift, night shift, or rotating shifts. Exploring solutions that will potentially improve sleep quality for night shift workers will aid in disease prevention and overall health within this patient population.D

The Melatonin Hypothesis

Research related to the pineal gland has advanced rapidly in the last three decades since the discovery of its most important hormone, melatonin. This indoleamine has been shown to have a large variety of effects in the organism; the bulk of these actions were initially thought to relate the pineal gland to the reproductive and endocrine systems. It is now apparent, however, that the physiologic interactions of the pineal and its hormones far transcend its control of endocrine function. One field of pineal research that has developed rapidly within the last 5 years has been the demonstration of its relationship to the immune system. Since the pineal gland is part of the central nervous system, these observations generally fall in the category of neuroimmunology, an area that, in its own right, has received a great deal of attention in the last decade. Thus, a NATO Advanced Study Course entitled "Role of Melatonin and Pineal Peptides in Neuroimmunomodulation" was convened in Erice, Sicily, on June 3-9, 1990. This

book is a result of the scientific presentations given at the workshop. The contributions to the book include mini-review articles which summarized the presentations of the invited speakers as well as a selected number of brief communications where the subject matter was in line with the theme of the Advanced Study Course.

Melatonin : clinical perspectives

Background and Aims: Circadian rhythm alterations resulting in disturbed sleep and disturbed melatonin secretion are flagship features of depression. In shift workers, an abnormal melatonin secretion has been reported to cause several psychiatric diseases including depression. Despite a well-established mechanism of melatonin synthesis in the brain, there is no comprehensive study of this pathway and its changes in the periphery. Therefore, the aim of this study is to assess the level of serotonin, ANAAT, ASMT and melatonin in the serum of patients with depression in the course of unipolar (UD) and bipolar (BD) disorders. Methods: For our study we included 50 patients with depression episode in course of unipolar (UP, n=25) and bipolar disorder (BP, n=25) in the age range 18-65 as defined by research criteria of ICD-10 (WHO, 1993). Clinical evaluation and sample collection were performed twice: at baseline and at time point K= remission - less than 8 points in Hamilton (17 item HDRS). Patients taking melatonin medication or undergoing chronotherapeutic intervention were not included into the study. Results: Data are

presented as means u00b1 standard deviations, medians, minimum and maximum values or percentage, as appropriate. All results were considered significant at p

This book documents the diverse research contributions of most of the major laboratories in the field of melatonin research, as presented in a special conference to mark the 40 year anniversary of the isolation and chemical identification of this hormone. In addition, many chapters by younger scientists provide an exciting glimpse of where melatonin research is heading in the future.

DYSFUNCTION OF MELATONIN EXPRESSION IN DEPRESSION U2013 PILOT STUDY

Melatonin has been found in every organism so far studied and most recently in a photosynthetic prokaryote, *Rhodospirillum rubrum* (Manchester et al., 1995) and a Purple bacteria *Erythrobacter longus* (Tilden et al., 1997). I studied melatonin

production in a Cyanobacterium *Synechococcus*. Sample sizes (N=6) were harvested at three hour intervals over a 24 hour period and melatonin levels were measured via radioimmunoassay. *Synechococcus* produced melatonin in a cyclic rhythm with significantly higher levels of melatonin present at night and lower levels present during the day. This pattern mirrors the cyclic production of melatonin in many organisms studied, including humans. These findings have generated hypotheses of possible reasons why melatonin would be produced in bacteria. Literary studies were also done on melatonin's potential applications in areas of medicine such as cancer, AIDS, sleep-wake disorders and fertility.

Melatonin and the Mammalian Pineal Gland

Designed for researchers, physicians, and lay people interested in the topic, *Melatonin in Health Promotion* examines virtually all aspects of the multifunctional hormone melatonin, a subject of intense scientific research and general interest. Topics addressed include how melatonin is synthesized; possible harmful side effects; and the role this hormone plays in diseases such as epilepsy, Alzheimer's, and cancer.

Melatonin for treatment of sleep disorders

In this book nutritionist Joel Blanchard cheerfully offers information specifically designed to help us create a reality of health, happiness and enlightenment for ourselves. He alerts us to the fact that our pineal glands have almost certainly become damaged by environmental conditions on this industrialized planet. Your pineal gland is responsible for making the majority of your melatonin, and the studies cited in this book suggest that melatonin may very well be the most powerful cell-protecting molecule in existence. From protecting your cells and eyesight to helping your body make antibodies, lower elevated blood sugar levels, and counteract many, if not all, forms of cancer – melatonin does it all. In addition to discussing how to heal your pineal gland in order to benefit from optimal melatonin levels, Joel discusses how healing your pineal gland can improve your perception, intuition, self-mastery, and insight. This gland is considered by many spiritual practitioners, philosophers, cultures, religions and researchers to be either the center of your “third eye” chakra or an information receiver, or both. Joel also discusses the role cannabis (marijuana) and dimethyltryptamine (DMT) can play in creativity, melatonin production and personal epiphanies. Are you ready to turn your pineal gland back on and start receiving the kind of creativity and body energy you had as a child, before your pineal gland became calcified? Are you ready to use your built-in Enlightenment App?

Melatonin Biosynthesis: The Structure of Serotonin N-Acetyltransferase at 2.5, A Resolution Suggests a Catalytic Mechanism, January 1999

This volume contains the proceedings of the Ninth Meeting of the "International Study Group for Tryptophan Research" (ISTRY), held at the University of Hamburg, Germany, from October 10 to 14, 1998. At this meeting the recent developments in the field of tryptophan research were presented by leading researchers from all over the world in 81 oral and 48 poster contributions. Research on tryptophan and its derivatives provides an inexhaustible subject. At the conference we tried to compose a multifaceted picture of the recent investigations through contributions from the major disciplines involved. Thus, we tried to strike a balance between basic research topics and clinical, nutritional or industrial applications. We offered workshops on tryptophan (in sleep and mood), melatonin, IDO-activation and the eosinophilia-myalgia syndrome (EMS) as a platform for intensive discussion for the participants. In these proceedings many contributions are multidisciplinary and have practical or theoretical implications for different research fields. Hence, we

have organized this volume in nine main chapters according to basic disciplines and subjects. We are aware that this classification is artificial, but we hope that it is the best compromise for contributors and readers.

Serotonin and Melatonin

Over the past decade, the potential of the pineal hormone melatonin as a therapeutic agent in a variety of diseases has been recognized. This book is the first to review the effect of melatonin in sleep disorders, its possible use as an immunoregulatory agent and clinical results obtained in cancer immunotherapy. Several papers are devoted to the pharmacological and molecular characterization of melatonin receptors in a variety of cell types. Other contributions further investigate the immunoenhancing effect of melatonin, such as in viral encephalitis and bacterial infections, and consider possible therapeutic indications. Melatonin is also reported to exert important hematopoietic effects by stimulating the production of novel T helper cell opioid cytokines. Other basic studies introduce new perspectives describing melatonin as a potent free radical scavenger. This book should be read by clinicians working in the fields of sleep disorders, oncology and infectious diseases as well as by scientists active in the field of neuroimmunomodulation. It will also be very useful to all those interested in melatonin as a therapeutic agent.
