The New Public Health

Since publication in 1958, George Rosen's classic book has been regarded as the essential international history of public health. Describing the development of public health in classical Greece, imperial Rome, England, Europe, the United States, and elsewhere, Rosen illuminates the lives and contributions of the field's great figures. He considers such community health problems as infectious disease, water supply and sewage disposal, maternal and child health, nutrition, and occupational disease and injury. And he assesses the public health landscape of health education, public health administration, epidemiological theory, communicable disease control, medical care, statistics, public policy, and medical geography. Rosen, writing in the 1950s, may have had good reason to believe that infectious diseases would soon be conquered. But as Dr. Pascal James Imperato writes in the new foreword to this edition, infectious disease remains a grave threat. Globalization, antibiotic resistance, and the emergence of new pathogens and the reemergence of old ones, have returned public health efforts to the basics: preventing and controlling chronic and communicable diseases and shoring up public health infrastructures that provide potable water, sewage disposal, sanitary environments, and safe food and drug supplies to populations around the globe. A revised introduction by Elizabeth Fee frames the book within the context of the historiography of public health past, present, and future, and an updated bibliography by Edward T. Morman includes significant books on public health history published between 1958 and 2014. For seasoned professionals as well as students, A History of Public Health is visionary and essential reading.

Mental Health as Public Health: Interdisciplinary Perspectives on the Ethics of Prevention

Petersen and Lupton focus critically on the new public health, assessing its implications for the concepts of self, embodiment and citizenship. They argue that the new public health is used as a source of moral regulation and for distinguishing between self and other. They also explore the implications of modernist belief in the power of science and the ability of experts to solve problems through rational administrative means that underpin the strategies and rhetoric of the new public health.

The Future of the Public's Health in the 21st Century

The Asia-Pacific region has not only the greatest concentration of population but is, arguably, the future economic centre of the world. Epidemiological transition in the region is occurring much faster than it did in the West and many countries face the emerging problem of chronic diseases at the same time as they continue to grapple with communicable diseases. This book explores how disease patterns and health problems in Asia and the Pacific, and collective responses to them, have been shaped over time by cultural, economic, social, demographic, environmental and political factors. With fourteen chapters, each devoted to a country in the region, the authors take a comparative and historical approach to the evolution of public health and preventive medicine, and offer a broader understanding of the links in a globalizing world between health on the one hand and culture, economy, polity and society on the other. Public Health in Asia and the Pacific presents the importance of the non-medical context in the history of human disease, as well as the significance of disease in the larger histories of the region. It will appeal to scholars and policy makers in the fields of public health, the history of medicine, and those with a wider interest in the Asia-Pacific region.

Oxford Textbook of Global Public Health

The public health movement involved numerous individuals who made the case for change and put new practices into place. However despite a growing interest in how we understand history to inform current evidence-based practice, there is no book focusing on our progressive pioneers in public health and environmental health. This book seeks to fill that gap. It examines carefully selected public and environmental health pioneers who made a real difference to the UK's health, some with international influence. Many of these pioneers were criticised in their life-times, yet they had the strength of character to know what they were doing was fundamentally right and persevered, often against many odds. Including chapters on: Thomas Fresh John Snow Duncan of Liverpool Margaret McMillan George Cadbury Christopher Addison Margery Spring Rice and others.? This book will help readers place pioneers in a wider context and to make more sense of their academic and practitioner work today; how evidence (and what was historically understood by it) underpins modern day practice; and how these visionary pioneers developed their ideas into practice, some not fully appreciated until after their own deaths. Pioneers in Public Health sets the tone for a renewed focus on research into evidence-based public and environmental health, which has become subject of growing international interest in recent years.

Conceptualising Public Health

In Germanic and Nordic languages, the term for 'public health' literally translates to 'people's health', for example Volksgesundheit in German, folkhälsa in Swedish and kansanterveys in Finnish. Covering a period stretching from the late nineteenth century to the present day, this book discusses how understandings and meanings of public health have developed in their political and social context, identifying ruptures and redefinitions in its conceptualisation. It analyses the multifaceted and interactive rhetorical play through which key concepts have been used as political tools, on the one hand, and shaped the understanding and operating environment of public health, on the other. Focusing on the blurred boundaries between the social and the medico-scientific realms, from social hygiene to population policy, Conceptualising Public Health explores the sometimes contradictory and paradoxical normative aims associated with the promotion of public health. Providing examples from Northern Europe and the Nordic countries, whilst situating them in a larger European and international context, it addresses questions such as: How have public health concepts been used in government and associated administrative practices from the early twentieth century up to the present? How has health citizenship been constructed over time? How has the collective entity of 'the people' been associated with and reflected in public health concepts? Drawn from a range of disciplinary backgrounds, the authors collected here each examine a particular way of understanding public health and assess how key actors or phenomena have challenged, altered or confirmed past and present meanings of the concept. Conceptualising Public Health is of interest to students and scholars of health and welfare state development from diverse backgrounds, including public health, sociology of health and illness, and social policy as well as medical, conceptual and intellectual history.

This volume argues the case that public health communication has affected health behavior. It brings together 16 studies of large-scale communication in a variety of substantive health areas--tobacco, drugs, AIDS, family planning, heart disease, childhood disease, highway safety--prepared by the authors who did the original research. These studies show important effects and illustrate the central conditions for success. The book also includes complementary analytic chapters which provide a meta-analysis of published results, some approaches to developing communication interventions, and alternative methods for evaluation of public health communication projects. Including studies based on communication programs in the United States, as well as projects done elsewhere in the world, including Europe, Africa, Asia and Latin America, this book: *offers a broad presentation of the alternative research designs that have been used to evaluate public health communication programs; *includes a great range of approaches from field experiments and natural experiments to simple before-after and complex time series designs, using data gathered from individuals and from archives; and *utilizes an innovative perspective on how to exercise public health communication from a leading and thoughtful practitioner.
