Now in full color, this text uses a unique age-specific organization to discuss all aspects of pediatric dentistry from infancy through adolescence. Each age-specific section covers the physical, cognitive, emotional, and social changes that children experience, as well as the epidemiology of dental disease at that age. Other chapters explore the examination, treatment planning, radiographic concerns, prevention, trauma, restorative dentistry, pulp therapy, orthodontics, and behavior management of each age range. Unique organization begins with an introduction to the basic information and topics pertinent to children of all ages, then divides up the rest of the text by age group to cover the specific changes the child experiences physically, cognitively, emotionally, and socially. In most cases, particular dental issues are discussed only once, at the point in a child's development at which they are most appropriate. Section on children from conception to age three covers conditions such as cleft palate, disturbances in calcification, unusual numbers of teeth, oral habits, caries, and the development of malocclusions that start during these years. Chapter on aesthetic restorative dentistry for the adolescent looks at material selection, tooth color and form, diastemas, discolored teeth, bleaching and more. Chapter on sport dentistry and mouth protection covers how to evaluate child/adolescent athletes, the different types of mouth protection available, and professional activities in sports dentistry. ## **Textbook of Preventive and Community Dentistry, 2e (PB)**

Dental disease accounts for more pain, suffering and loss of work ing hours than almost any other disease. And yet, since no one dies as a result of dental disease and since tooth loss is still regarded incorrectly as a normal consequence of ageing, there has been no major emphasis towards or demands for the preventive aspect of dentistry. By tradition, dentistry has been largely a reparative profession. However, reparative dentistry alone cannot bring about the control of dental disease which has now reached epidemic proportions in some countries. Over the past decade, the results of basic research, applied research and clinical trials from many parts of the world have shown that preventive dentistry can be highly successful. This book deals with the prevention of dental caries and has been written for the dental practitioner, the dental student, the post graduate worker and those engaged in dental research. Basic knowledge of the disease mechanisms, the tissues they affect and the scientific basis for each preventive technique described have been presented. Preventive dentistry requires a team approach; the dentist being the leader, with the other ancillary workers acting as important members of the team.

This book is derived from a series of articles written for dental practitioners and first published in Dental Update. The articles were written as a consequence of running a weekly clinic, concerned largely with the correction of referred endodontic problems. In most cases the 'problems' did not exist and were treated simply by redoing the root filling or by undertaking a straightforward apicectomy. Regrettably, in many other cases, the problem would not have existed had the previously undertaken, and potentially simple, apicectomy been carried out competently. There is no good reason why apical surgery should not be undertaken by the general dental practitioner as part of the patient's overall treatment. After all, the problem will usually have arisen either during, or as a result of, routine dental treatment. In addition, the tooth may require to be restored, either at the time of surgery or fairly soon thereafter. Regrettably,

inexperience in the handling of soft tissues, and concern about the risk of damage to associated structures, often deters the dentist from attempting what is, if sensibly approached, an uncomplicated minor dento-alveolar operation. Chapters 1-8 introduce the reader to the basic techniques of apicectomy. Chapters 9, 12, 16 and 17 will, it is hoped, help the interested dentist to develop a competence to treat more complex cases, once he or she has become proficient in the basic skills.
