Vascular Diseases: New Insights for the Healthcare Professional: 2012 Edition

Although peripheral arterial disease (PAD) is often unrecognized or neglected by physicians, it affects twenty percent of older persons, causes considerable disability-including loss of limbs-and is an indicator of similar disease in the heart and other blood vessels. In *Peripheral Arterial Disease: Diagnosis and Treatment*, a panel of recognized experts comprehensively reviews the clinical, surgical, radiological, and scientific aspects of atherosclerotic peripheral arterial disease (PAD), large vessel vasculitis, and thromboangiitis, including endovascular, gene, and drug therapies. In their far-ranging discussions, the authors examine in depth the risk factors and antiplatelet therapies for PAD patients in danger of a heart attack and/or stroke, the important role of exercise rehabilitation, the surgical and catheter-based approaches to revascularization, the preoperative evaluation, and the perioperative management of the vascular patient. They also discuss the special problems of peripheral arterial disease in women, management of the diabetic foot, large vessel vasculitis, thromboangiitis obliterans, and atheroembolism. Completing this detailed overview is important information on ameliorating the risk factors for PAD, its pathogenesis and epidemiology, and the physiological and pathophysiological basis of available diagnostic tests. Authoritative and comprehensive, *Peripheral Arterial Disease: Diagnosis and Treatment* provides a detailed accounting of the medical, surgical, and radiological aspects of peripheral arterial obstructive disease, empowering today's clinicians and specialists with the knowledge and skills necessary to diagnose and treat this important but often overlooked disorder.

Peripheral Vascular Disease, an Issue of Interventional Cardiology Clinics

Cardiovascular disease (CVD) is the leading cause of morbidity and mortality in the United States and most westernized nations. Both CVDs and their risk factors confer substantial risk for stroke and dementia, but are also associated with more subtle changes in brain structure and function and cognitive performance prior to such devastating clinical outcomes. It has been suggested that there exists a continuum of brain abnormalities and cognitive difficulties associated with increasingly severe manifestations of cardiovascular risk factors and diseases that precede vascular cognitive impairment and may ultimately culminate in stroke or dementia. This second edition examines the relations of a host of behavioral and biomedical risk factors, in addition to subclinical and clinical CVDs, to brain and cognitive function. Associations with dementia and pre-dementia cognitive performance are reported, described, and discussed with a focus on underlying brain mechanisms. Future research agendas are suggested, and clinical implications are considered. The volume is a resource for professionals and students in neuropsychology, behavioral medicine, neurology, cardiology, cardiovascular and behavioral epidemiology, gerontology, geriatric medicine, nursing, adult developmental psychology, and for other physicians and

health care professionals who work with patients with, or at risk for, CVDs.

Pregnancy stresses the heart and circulatory system. During pregnancy, blood volume increases by 30 to 50 percent. The amount of blood the heart pumps each minute also increases by 30 to 50 percent, and heart rate increases as well. These changes cause the heart to work harder, as do labor and delivery. This issue covers diagnosis and treatment of cardiac symptoms and cardiac emergencies during pregnancy.

Peripheral Vascular Disease

Cardiovascular disease (CVD), once thought to be confined primarily to industrialized nations, has emerged as a major health threat in developing countries. Cardiovascular disease now accounts for nearly 30 percent of deaths in low and middle income countries each year, and is accompanied by significant economic repercussions. Yet most governments, global health institutions, and development agencies have largely overlooked CVD as they have invested in health in developing countries. Recognizing the gap between the compelling evidence of the global CVD burden and the investment needed to prevent and control CVD, the National Heart, Lung, and Blood Institute (NHLBI) turned to the IOM for advice on

how to catalyze change. In this report, the IOM recommends that the NHLBI, development agencies, nongovernmental organizations, and governments work toward two essential goals: creating environments that promote heart healthy lifestyle choices and help reduce the risk of chronic diseases, and building public health infrastructure and health systems with the capacity to implement programs that will effectively detect and reduce risk and manage CVD. To meet these goals, the IOM recommends several steps, including improving cooperation and collaboration; implementing effective and feasible strategies; and informing efforts through research and health surveillance. Without better efforts to promote cardiovascular health, global health as a whole will be undermined.

Percutaneous Approaches to Valvular Heart Disease, An Issue of Interventional Cardiology Clinics - E-Book

Patients with peripheral vascular disease (PVD) are at increased risk of death when compared with age-matched healthy controls. They are also, whether symptomatic or not, six times more likely to die within ten years when compared to patients without the disease. This excess mortality exists even if coronary artery disease is not clinically present, and makes the treatment of PVD a highly important and pressing topic. In this fully up-to-date text, Dr. Mukherjee and his excellent team of twenty-one contributors present the reader with all of the currently available clinical information for treating PVD patients effectively.
